Session Topics

- ✔ Identify business problems that can potentially be solved using AI
- ✔ Understand business processes and identify pain points
- ✔ Define measurable business outcomes
- ✔ Assess AI use cases based on feasibility and data availability
- ✔ Evaluate business impact and potential risks
- ✔ Prioritise AI initiatives using Value vs Complexity
- ✔ Identify key stakeholders and ownership
- ✔ Create a structured AI Use-Case Canvas

What is an AI Use Case?

Component	Example	Description
Business Problem	Too many customer support queries	Agents spend time on repetitive questions.
Data	Historical queries	Past tickets and FAQs.
AI Capability	NLP / Generative AI	Understand and generate responses.
Solution	AI Chatbot	Automatically answers common questions.
Expected Outcome	Reduce response time	Faster and consistent support.
Business Value	Improve customer satisfaction	Happier customers and lower cost.

Identifying Business Problems Suitable for AI

AI implementation should begin with a business problem—not with technology.

The objective is to identify:

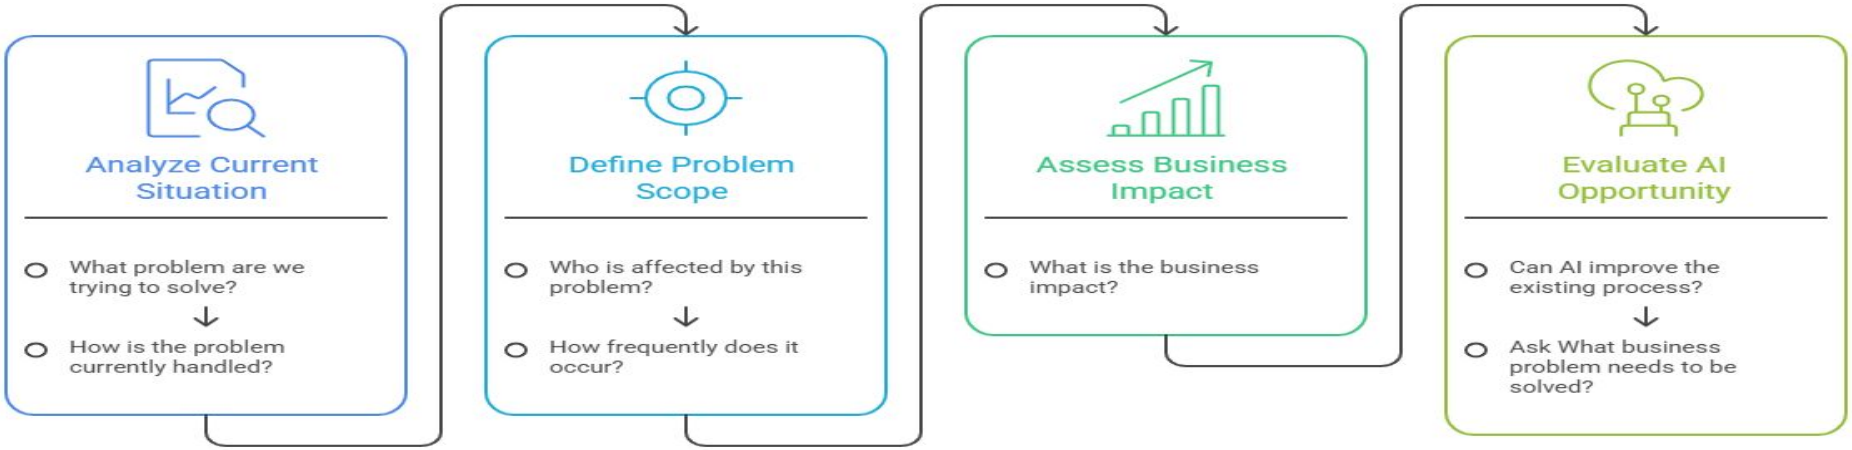

- ✔ Where business processes are inefficient
- ✔ What challenges employees and customers face
- ✔ Which activities involve repetitive work or complex decisions
- ✔ Where data can help improve outcomes
- ✔ Whether AI can provide measurable business value

Start with the Business Problem

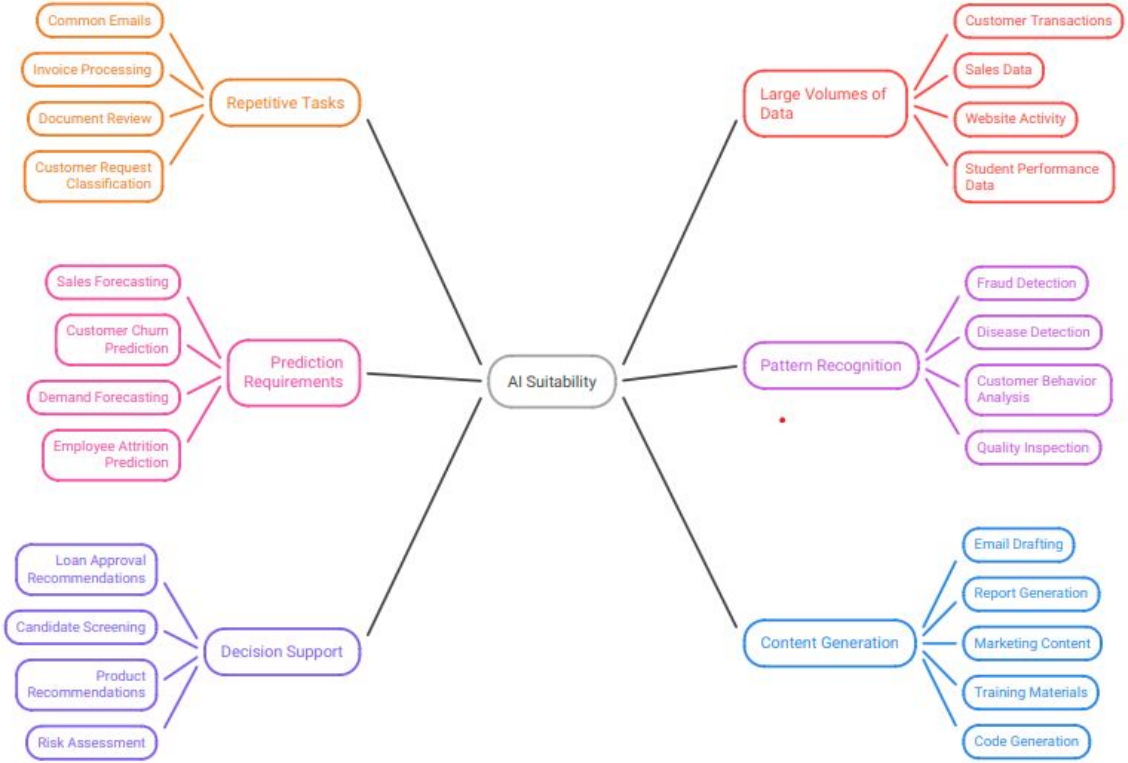

Important Principle:
Don't ask "Where can we use AI?"
Ask "What business problem needs to be solved?"

Examples of Business Problems Across Departments

1	**HR Resume Screening** AI Resume Screening for too many resumes to review.
2	**Sales Forecasting** Sales Forecasting for difficulty predicting sales.
3	**Personalized Recommendations** Personalized Recommendations for generic campaigns.
4	**AI Chatbot** AI Chatbot for high volume of queries.
5	**Intelligent Document Processing** Intelligent Document Processing for manual invoice processing.
6	**Predictive Maintenance** Predictive Maintenance for equipment failures.
7	**Personalized Learning** Personalized Learning for different student learning levels.
8	**AI-assisted Diagnosis** AI-assisted Diagnosis for difficulty analyzing reports.

Map Process and Pain Points

What is Process Mapping?

Process mapping means visually understanding:

How work currently happens from start to finish.

Before implementing AI, organizations should understand the existing workflow.

SKILLOGIC

Identifying Pain Points

A **pain point** is any part of a business process that causes problems.

Common Pain Points

- Takes too much time
- Requires repetitive work
- High manual effort
- Frequent errors
- Delayed decision-making
- High operational cost
- Poor customer experience
- Difficult to scale
- Dependency on specific employees

Pain Analysis Example

SKILLOGIC

Process Mapping Questions

When analysing a process, ask:

Process Questions

- What is the current process?
- Who performs each task?
- How much time does each task take?
- Which tasks are repetitive?
- Where do errors occur?
- Where are delays happening?
- What decisions are difficult?
- What data is being generated?
- What tasks require human intelligence?
- Where could AI provide assistance?

SKILLOGIC

Define Expected Business Outcomes

- **Move from "Tactical" to "Strategic":** Don't just define what the AI will *do*, define what the AI will *achieve*.
- **The "So What?" Test:** After describing the use case, ask "So what?" until you reach the ultimate business value.

Common Business Outcomes

SKILLOGIC

Converting Problems into Measurable Outcomes

Weak Objective

"Improve customer **service using AI.**"

- Too vague
- Not measurable
- No clear timeline
- Difficult to track

Make it SMART

Strong Objective

"Reduce average customer response time from **10 minutes** to **2 minutes** within **six months.**"

- Specific
- Measurable
- Time-bound
- Clear and actionable

SMART Business Outcomes

Business outcomes should be:

S	M	A	R	T
Specific	**Measurable**	**Achievable**	**Relevant**	**Time-bound**
Clearly define what will be achieved.	Use numbers to track progress.	Be realistic and attainable.	Align with business goals.	Set a clear deadline.

Example: Measurable Business Outcomes

Area	Before AI (Current State)		Target After AI (Desired State)
Response Time	10 minutes	→	2 minutes
Manual Work	8 hours/day	→	3 hours/day
Error Rate	12%	→	Below 3%
Customer Satisfaction	75%	→	90%

What is AI Feasibility ?

Four Major Feasibility Areas

Assess Technical Feasibility

- Is suitable AI technology available?
- Can the existing systems integrate with AI?
- Do we have technical infrastructure?
- Do we have skilled resources?

Evaluate Operational Feasibility

- Will employees adopt the solution?
- Does the process support automation?
- Are stakeholders willing to change?
- Can the organization maintain the solution?

Analyze Financial Feasibility

- What is the implementation cost?
- What is the expected return?
- Is the investment justified?

Review Legal and Compliance

- Are there privacy concerns?
- Can customer data be used?
- Are there regulatory restrictions?
- Is the AI decision explainable?

AI use cases based on Data Availability ?

AI System Depend on Data

No relevant data → Limited AI capability

However, more data does not always mean better AI.

The important factors are:

- Availability
- Quality
- Relevance
- Accessibility
- Security

Data Readiness Assessment

Evaluate whether we have the right data for AI success.

Data Availability	Do we have the required data?	Present and accessible
Data Quality	Is the data accurate and complete?	Clean, reliable, consistent
Data Accessibility	Can the AI system access the data?	Accessible via systems, APIs etc.
Data Volume	Is there sufficient data?	Enough data for training and testing
Data Privacy	Can we legally and ethically use the data?	Compliant with regulations

Access Business Impact ?

Business impact refers to:

"How much value will the AI solution create for the organization?"

Simple Impact Questions	Rate each question from 1 to 5				
Question	Score (1–5)				
Will it reduce cost?	1	2	3	4	5
Will it increase revenue?	1	2	3	4	5
Will it save employee time?	1	2	3	4	5
Will it improve customer experience?	1	2	3	4	5
Is it strategically important?	1	2	3	4	5

Impact Evaluation Areas

Financial Impact

- Revenue increase
- Cost reduction

Stronger financial performance

Operational Impact

- Time saved
- Productivity improvement

More efficient operations

Customer Impact

- Better experience
- Faster service

Happier customers

Strategic Impact

- Competitive advantage
- Innovation

Long-term growth

Higher score = Higher potential impact.

Focus on use cases that create real, measurable business value.

Access AI RISKS ?

Common AI Risks

1 Data Privacy Risk

Example:
Using customer personal information without proper authorization.

Protect personal and sensitive data.

2 Bias Risk

Example:
An AI recruitment system unfairly favouring certain candidates.

Ensure fair and unbiased AI.

3 Accuracy Risk

Example:
An AI chatbot providing incorrect information.

Validate outputs and use human review.

4 Security Risk

Example:
Sensitive company information being exposed through an AI system.

Implement strong security controls.

5 Compliance Risk

Example:
AI decisions violating industry regulations.

Follow regulatory and legal requirements.

6 Adoption Risk

Example:
Employees refusing to use the new AI system.

Drive awareness, training and change management.

Risk Assessment Matrix

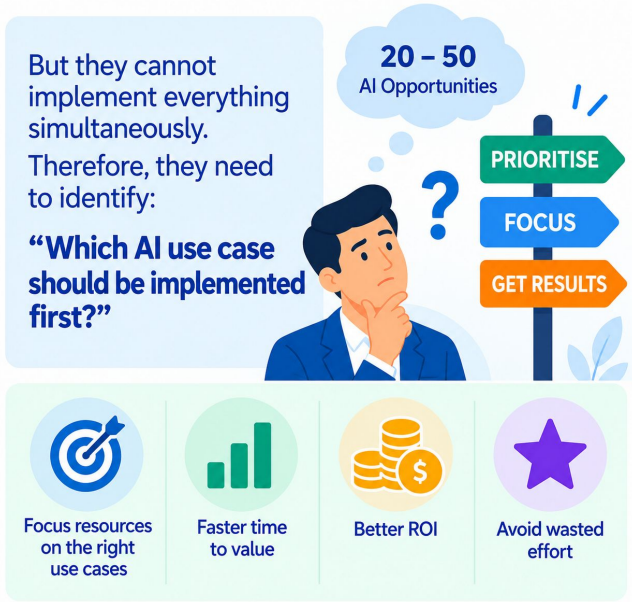

Risk	Probability	Impact	Mitigation
Data leakage	Medium	High	Data security controls
Incorrect output	High	Medium	Human validation
Bias	Low	High	Bias testing
Employee resistance	Medium	Medium	Training & change management

AI Use Case Prioritization Framework

Priority Matrix

Business Value	Complexity	Priority
High	Low	Very High
High	High	Strategic
Low	Low	Medium
Low	High	Low

SKILLOGIC

Datamites

© 2025 Skillogic ® DataMites™. All Rights Reserved

AI Use Case Scoring Framework

Criteria	Weight
Business Value	30%
Data Availability	20%
Technical Feasibility	15%
Implementation Complexity	15%
Strategic Alignment	10%
Risk Level	10%

Score each criterion (e.g. 1 to 5)

- Higher total score = higher priority
- Adjust weights based on your organisation's goals
- Use this to compare multiple use cases

Example Use Case Scoring

Use Case	Business Value (30%)	Data Availability (20%)	Technical Feasibility (15%)	Implementation Complexity (15%)	Strategic Alignment (10%)	Risk Level (10%)	Total Score	Priority
AI Chatbot	5	5	5	2	4	3	4.3	High
Churn Prediction	5	4	4	4	4	3	4.1	Medium
Predictive Maintenance	5	2	2	5	4	4	3.2	Low

Identify key stakeholders and ownership

Why Ownership is Important?

- Ensure Clear accountability
- Drives commitment and faster decision-making
- Brings together the right people to deliver business value

What is an AI Use-Case Canvas ?

A Structured framework used to document and evaluate an AI Opportunity.

1 Use Case Name
What is the name of the AI initiative?

AI-Powered Customer Support Assistant

2 Business Problem
What problem are we trying to solve?

Customer support agents spend too much time answering repetitive questions.

3 Current Process
How is the process currently performed?

Customer → Support Ticket → Agent → Knowledge Base Search → Response

4 Pain Points
What are the major challenges?

- Long response times
- Repetitive queries
- High workload
- Inconsistent responses

5 Proposed AI Solution
How can AI help?

An AI chatbot can answer common customer questions automatically.

6 Required Data
What information is required?

- FAQs
- Previous support tickets
- Product documentation
- Customer interaction history

7 Expected Business Outcome
What improvement do we expect?

- Reduce response time by 70%
- Reduce support workload by 40%
- Improve customer satisfaction

8 Stakeholders
Who is involved?

- Customer Support Manager
- IT Team
- AI Team
- Customer Support Agents

9 Risks
What could go wrong?

- Incorrect responses
- Customer data exposure
- Poor AI accuracy
